Website Design
Task 3

4.2B
Megan Bartolo

Starting off

When creating this website, I started off by designing my later to be chosen elements in Photoshop, as I find myself able to work easier when adding imagery early on in to my code as it gives me an outline of how I plan to further design my website in the future. It also gives me a basic idea of how I want the layout to look like.

I then boot up Visual studio code, and get to coding. I start out a new ---, naming it index.html. and add in <DOCTYPE!> to start off the coding.
I proceed to put in my chosen title in the <head>, 'Impeccable interests'. I do this by using <title>.

Right off the bat, I put in links to the Styles.css file. This is the style that stylizing the website mainly took place. I made use of the link took along with href. I close off head using </head> putting all my code in to a box.

Scope and Objectives
The objective of building a page for Marsha Suarez who is a fictitious influencer was to have an additional repository that is capable of having more in-dept detail and information to support Social Media Content. As we all know, Social Media content is very fast and is targeted to people with a short attention span to get a message in less than 10 seconds. The website is for those who are interested to know more, get in touch and ultimately have an ecommerce portal where they can purchase merchandise. In other words, it is a way to monetize content. In addition to this, the page was designed to support articles that can cross promote brands that in return will give sponsorships to the influencer.

Design and Layout
The design was initiate by deciding on what pages are going to feature on the page, their connectivity and their function.

The Home Page
Planning and work started on the home page (index.htm). The main code for the home page was written on this page however, the styling was done on a *.css* page called styles. This stylesheet was linked to the main page so in code, I could reference to it.
Main Menu
The main menu is common in all of the pages as it is the main navigation tool for the website. This was coded using the first header *<h1>* of the page. In *h1,* I put 4 links that will take you to the desired page using *href*. *H1* was defined in the styles page as a reference with the inclusion of a hover over text underline effect.

Secondary Banners with Links

The second element in all pages consists of the main banner. In this case it has no link to it so it is just using an *img scr* to place the banner. Banner is designed to fit the spec using Photoshop. A challenge I faced was defining the image size to as to fit a traditional screen however after many trials and errors I manages to find the right size to fir the page perfectly. It is very important to note that once I was happy with the size, all the specs were defined in the styles page. This included, background color, height, width, text alignment and padding.

The 3rd element of the homepage is the 3 different banners that link to separate pages that are hidden from the main menu. This is part of the H2 and I used the Row and Column class to align them using styles *Css*. The row and column sizes were defined in the styles sheet.

The end of the page, I put the credits in simple text and also a link to an email using the *mailto* class.

In the about me page, I used a form (fieldset) to embed the text in a nice format. The Legend is the title of each text block.

The blogs page uses an Href function to link to the featured blogs. At this stage of development, all is hard coded and featured blogs are pre-set and not automatically generated.

Contact Page
For the contact page, I used a form as a shell however each field was coded to fit a specific functionality.
A type 'Text' was used for name and surname.
A type 'Email' was used to create an email field
A type 'Password' was used to create a password field
A Select class was used to create a drop down menu which items were hard coded.
A Checkbox class was used to create a multiple choice

This journey was quite a learning experience and some items I was learning along the way. Some mechanics that were originally designed were too advance for me to implement so in some instances I had to find a compromise. Some if the improvements would be the following:

1. I would have had form that would collect the data that is submitted in the Contact me page.
2. I would implement a banner carousel that would change with time and hoe the website so static
3. I would implement direct iframes to the latest Instagram content.
4. I would have an auto generated featured blogs.

TARGET AUDIENCE

As for my the target audience I mainly aimed for going after the influencers fan-base, most likely in the teenage to young adult range.

COULD I HAVE MADE ANY POTENTIAL IMPROVEMENTS?

Improvement wise, I feel as though I definitely could have definitely perfected the alignment, as well as the visuals involved.

WHAT HAVE I LEARNT FROM THIS EXPERIENCE?

Creating this website has thought me the basics of using visual studio code along with learning how to use CSS and GitHub. It has thought me how to code and design a website for any occasion, possibly aiding me in the future for creating custom portfolios relating to my future in the art industry.

Ecommerce

I could eventually set up a shopping page for people to buy any potential created merchandise created by the influencer or her team. Since she is an influencer, they make money on merchandise so we would have items on there for sale by creating a page with a merchandise section within our website.

News Group

Another way I could potentially improve the website is by adding different news group links that link to forums such as a Discord server or a Reddit page. These would aid in the fanbase coming together as a community and a space where people could interact and help eachother if any potential problems were to arise.
